

Solidmation

« Habeetat Planner

Habeetat Planner is an advanced software that allows end-users to create plans, events, and macros, and make them accessible from mobile phones, PCs and PDAs.»

Main characteristics

- Runs on any standard Windows PC (Windows Server 2008 recommended).
- A powerful, yet small-sized hardware-based version is available through Habeetat HPA-6200, which brings in all the benefits of Habeetat Planner without the need to use a regular PC.
- Handles the process of adding, replacing and configuring devices in your Habeetat environment.
- Allows you to create your own plans and make them accessible from the Internet with an intuitive drag-and drop interface.
- Allows for the creation of powerful macros with a very simple user interface.
- Allows you to define timed events or others based on the activation of specific devices, so that you can automate repetitive tasks such as irrigation, swimming pool filtering, etc.
- Includes full integration with multi-room Sonos systems.
- Compatibility with the ZigBee wireless standard, Habeetat and PLCBus.
- Includes integration with IP cameras and DVRs with HikVision, Axis and Foscam.
- Support for Wi-fi thermostats.
- Support for Habeetat infrared transceivers, allowing you to control all third-party products that can be operated through a remote control.
- Support for electricity / water / gas metering through Habeetat wireless pulse counters.
- Zero-configuration remote access using an SSL tunnel to Solidmation's servers.
- Configurable notifications via Twitter or e-mail, can include real-time snapshots taken from video cameras.
- Automated backups to the cloud.
- Includes a scripting engine that allows you to build your own complex programs in your preferred programming language (Jscript, VBScript, or Pascal).
- Based on an open architecture that is permanently updated to include devices from other vendors.

Main functionalities

Plan designer

This functionality allows you to define an unlimited number of plans, so that the user interface is exactly what you want it to be. Create a single plan for your whole home, or separate plans for each room, depending on your preferences. You can even create separate versions of each plan to be used in mobile phones, in-wall touch-screens, or PCs.

Scenes

The scene designer allows you to configure any number of scenes in which your Habeetat devices will participate. Habeetat Planner provides a very simple user interface to update your scene configuration and upload that configuration to your devices automatically.

Macros

This feature allows you to define sequences of actions, possibly combining multiple devices. A simple and intuitive user interface allows you to quickly create complex actions such as "close all blinds in the house, turn the music off in all rooms, and engage the alarm system 20 seconds later", all of this with just a few clicks.

Macros can then be used anywhere else in the system, from a button dropped in a plan, a physical switch by the front door, or a timed event.

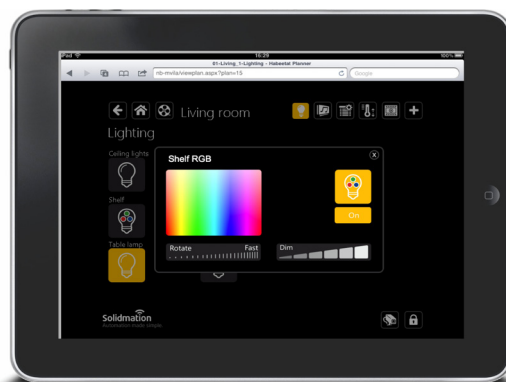

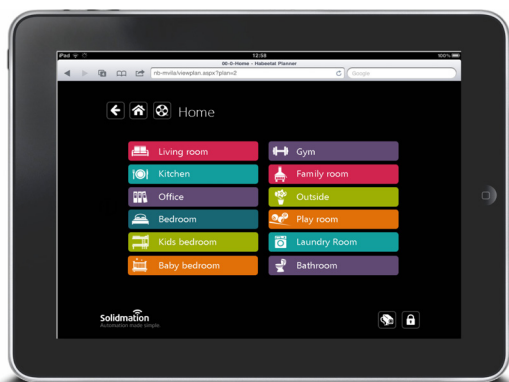

Scripts

Scripts are an advanced form of macro that enables you to create very complex actions that may even depend on the state of specific devices. Actions such as "open the garage door if the security system is not engaged, and it's past midnight" can be programmed easily in any of your favorite programming languages (from Javascript, VBScript, or Pascal).

Connectivity

Those plans that you created with the Plan designer become immediately accessible through the internet, and they can be browsed from mobile phones, PDAs, PCs, and any other device capable of displaying web pages.

Access from outside your home network is protected by Solidmation's Anywhere Access technology, which allows you to access your home installation from anywhere in the world through a private and secure HTTPS connection.

Los productos de domótica de la línea Habeetat mejoran la vida cotidiana a la vez que cuidan el medio ambiente.
